

## Meeting notes - 21.02.2025

Hugo Crespo, representing the Data Engineer team, opened the meeting and updated the other teams on the work the engineers had completed over the last week. Starting with a small design, they created a data structure that contained all the data needed for the analysis. After consulting with the data analysts and data scientists, they added the data requested by the other teams. Hugo defined the search for the required data as a future task for the engineers, as well as the merging of different data sources.

For the team of data analysts, Luis explained that they helped the engineers to define the data structure by finding suitable data. The analysts then created a first draft of the dashboard. The problems they faced were choosing the right metrics and finding the best design for the dashboard in terms of usability.

As for the next task for the analysts, Alejandro mentioned that they will refine the dashboard in collaboration with the other teams. They will also help the engineers to find the data they need and to understand the data better.

Regarding the team of data scientists, Matías explained that they also contributed to the process of designing the data structure and finding the data, together with the engineers and analysts. He also said that the scientists started looking for papers related to the topics they wanted to cover in the analysis.

According to Nele, one problem the data scientists faced was that they initially looked too deeply into individual topics and did not focus on getting a general overview of each topic they wanted to cover. She went on to say that the next task for the scientists will be to look more closely at the papers they have found.

The whole football team agreed that the next steps should be for everyone to help the engineers find the data they need, so that the engineers can then think about how to combine data from different sources.
